Education

Carleton University

Ottawa, ON

Bachelor of Engineering (B.Eng.) - Computer Systems Engineering

Expected Apr 2029

- **Relevant Courses:** Data Structures and Algorithms, Computation and Programming, Foundation of Imperative Programming, Object Oriented Software Development

Experience

Software Developer

Sept 2026 - Present

Obsidian Leadership Development Centre

Remote

- Migrating legacy WordPress website into a React-based application with reusable components and existing mailing infrastructure, improving maintainability and enabling faster future feature development.

Electrical Subteam Member

Sept 2025 - Apr 2026

Carleton Planetary Robotics Team

Ottawa, ON

- Redesigned the team STM32-based robot control base station PCB in Altium Designer, improving modularity and simplifying future hardware revisions.
- Collaborated with the electrical subteam during PCB design reviews, evaluating schematic, layout, and component tradeoffs to improve manufacturability and long-term maintainability.
- Assisted with schematic validation, component selection, and PCB bring-up by verifying hardware functionality and supporting iterative design improvements.

Projects

ClashRecruit | Website

[GitHub](#)

Python, Flask, Celery, MongoDB, JavaScript, React, AWS EC2

- Built and deployed a full-stack Clash of Clans recruitment platform on **AWS EC2** using React, Flask, and MongoDB, providing players with a centralized platform to discover and manage clan listings.
- Designed session-backed Flask API endpoints for authenticated clan listing management, eliminating repeated authentication across user actions.
- Reduced Clash API requests from every user interaction to once **every 24 hours** by caching Town Hall metadata unavailable through the API, improving response times while significantly reducing external API usage.
- Maintained a live directory of **350+** active clan recruitment listings, providing players with a continuously updated marketplace for clan discovery.

CourseTrack | CTRL-HACK-DEL 2.0 Hackathon

[GitHub](#)

Python, Flask, MongoDB, OpenRouter, Google Calendar API

- Built a syllabus-to-calendar workflow that converts uploaded course syllabi into reviewable event data and exportable **.ics** files, allowing users to import deadlines directly into calendar applications.
- Eliminated redundant AI parsing by caching **SHA-256** syllabus metadata in **MongoDB** and reusing prior extraction results for duplicate uploads, reducing API costs and improving processing efficiency.
- Integrated **Google Gemini** through OpenRouter to extract structured event JSON, using **Google OAuth 2.0** for authorization and the Google Calendar API to sync user-approved events automatically.

WatchDog | 2nd Place Overall, Dev0 Hackathon

[GitHub](#)

Python, Kotlin, WebSockets, OpenCV

- Built a WebSocket-based backend maintaining persistent desktop-mobile communication, streaming device status updates every **0.2 seconds** while supporting remote device lock commands.
- Implemented multi-stage threat confirmation using automatic intruder snapshots, configurable JSON alerts, and cooldown-based filtering to reduce false positives.
- Developed a Windows workstation locking service that automatically secured devices upon confirmed threats or remote client commands, preventing unauthorized access.

Skills

Languages: Python, Java, C, TypeScript, JavaScript, HTML/CSS, Kotlin, Bash

Tools/Frameworks: Git, React, Docker, Linux, AWS EC2, MongoDB, Flask, Celery, WebSockets, Altium
