Education

Carleton University

Ottawa, ON

Bachelor of Engineering (B.Eng.) - Computer Systems Engineering

Expected Apr 2029

- **Relevant Courses:** Data Structures and Algorithms, Computation and Programming, Foundation of Imperative Programming, Object Oriented Software Development

Experience

Electrical Subteam Member

Sept 2025 - Apr 2026

Carleton Planetary Robotics Team

Ottawa, ON

- Redesigned the team's robot control base station PCB in Altium, making the **STM32-based board** more modular and simplifying future hardware revisions.
- Collaborated with the electrical subteam on PCB design reviews, evaluating hardware changes and design tradeoffs for future revisions.

Projects

ClashRecruit | [Website](#)

[GitHub](#)

Python, Flask, Celery, MongoDB, JavaScript, React, AWS EC2

- Built and deployed a full-stack Clash of Clans recruitment platform on **AWS EC2** using React, Flask, and MongoDB, enabling players to discover and manage clan listings online.
- Designed session-backed Flask API endpoints enabling authenticated users to create, renew, and manage clan recruitment listings without repeated authentication.
- Reduced Clash API requests from every user interaction to once per **24 hours** by caching unsupported Town Hall metadata, improving response times and decreasing external API usage.
- Supported a live directory of **350+** active clan recruitment postings, enabling players to discover and engage with a large pool of available clans.

CourseTrack | *CTRL-HACK-DEL 2.0 Hackathon*

[GitHub](#)

Python, Flask, MongoDB, OpenRouter, Google Calendar API

- Built a syllabus-to-calendar workflow that converts uploaded course syllabi into reviewable event data and exportable **.ics** files, allowing users to import deadlines directly into calendar applications.
- Designed Flask endpoints to handle syllabus uploads, trigger parsing workflows, and return structured event data, enabling users to review and approve generated calendar events.
- Reduced AI parsing by caching **SHA-256** syllabus metadata in **MongoDB** and reusing prior extraction results for repeat uploads, improving system efficiency and reducing unnecessary API calls.
- Integrated **OpenRouter** to extract structured event JSON and **Google OAuth 2.0** to sync approved events with Google Calendar, allowing users to automatically import verified events.

WatchDog | *2nd Place Overall, Dev0 Hackathon*

[GitHub](#)

Python, Kotlin, WebSockets, OpenCV

- Built a WebSocket-based backend to stream device status updates every **0.2 seconds** and receive remote lock commands, maintaining a persistent connection between desktop and mobile devices.
- Implemented threat confirmation logic with automatic intruder snapshots and optional JSON alerts triggered after a **3-event streak** with a **10-second cooldown**, reducing false alarms.
- Developed a Windows workstation locking mechanism that locked the device in response to confirmed threats and remote client commands, protecting devices from unauthorized use.

Skills

Languages: Python, Java, C, JavaScript, Kotlin, HTML/CSS, Bash

Tools/Frameworks: Git, React, Docker, Linux, AWS EC2, MongoDB, Flask, Celery, WebSockets, Altium
